

ABSTRACT OF THE DISCLOSURE

A housing for hot-pluggable network tap modules. The housing allows a user to maintain all network taps in any given system in one housing and location. This increases the ease of maintaining multiple network taps and allows the network tap modules to be powered by a power supply included with the housing. The housings can greatly simplify the process of managing multiple taps. Moreover, the housings are compatible with hot-pluggable network tap modules as well as legacy network tap modules that were developed in the past.
